Profile

Senior backend engineer with 6+ years building and leading distributed systems at scale, most recently at GoFundMe and before that at Mercado Libre. I own projects end to end: PRD, system design, estimation, story breakdown and delivery. At GoFundMe I led three Trust & Safety platforms — AI content moderation, user reporting and an LLM-powered crisis management tool — taking automated moderation coverage from ~40% to over 90% across tens of thousands of fundraisers per day. I work natively in English with distributed US/LatAm teams, and run discovery with non-technical stakeholders as comfortably as I work in the code.

Education

Electronics Engineering · Facultad de Ingeniería de la Universidad de Buenos Aires - FIUBA

2010 - 2019

GPA: 8.76 / 10 · Thesis: Software Defined Radio (SDR) system on FPGA and analog front-end — QAM & PSK transceiver (Grade 10/10)

Physics I · Teaching Assistant (Chair: Garea, ad honorem), 2011

Work Experience

Senior Software Engineer · GoFundMe

December 2024 - October 2026
Integrity / Trust & Safety · 5-7 engineers, distributed Argentina & US · Remote, fully in English

Led three consecutive platform projects end to end (~6 months each) in Trust & Safety, one of the company's top-priority areas: PRD, technical design, estimation, story breakdown, task assignment and delivery.

AI content moderation platform. Integrated a third-party AI moderation provider for fundraisers and accounts, designing and building the full action layer GoFundMe executes in response to its webhooks as an **event-driven pipeline on Kafka with Avro schemas**. Replaced a keyword-matching tool plus manual review, taking coverage of fundraisers identified for moderation **from ~40% to over 90%** at a volume of **tens of thousands of fundraisers per day**. Later began migrating the integration to **Cinder**, delivering the case-management

consumer that routes reports and lets analysts review reported profiles and comments.

User reporting platform. Led the design and build, from scratch, of GoFundMe's reporting system for comments, messages and profiles — the full **GraphQL API**, reporting widget, data model and AI moderation integration — reusing the action layer from the previous project. Delivered with one frontend engineer; presented the launch at company all-hands.

Crisis Management Tool (LLM-powered). Led the internal tool Trust & Safety agents use to manage large-scale crises and the many fundraisers each one generates, replacing a fully manual spreadsheet process; around 10 concurrent crises in production. Designed and built the full crisis-definition lifecycle behind a **GraphQL API** (schemas, fetchers and mutations), the orchestration against Applied Science's LLM hosting service — including graceful handling of generation failures — and the evaluation pipeline behind a **layered pre-filter that routes only ~3-4% of events to the model**, controlling cost and latency. Evolved the event schemas **backward-compatibly** so new fundraiser signals reached evaluation without breaking downstream consumers. Built the human-in-the-loop workflow with **analyst decisions authoritative over automated tagging**, and audit logging with SSO identity resolution for full traceability. At validation cutover the system tagged **9,828 fundraisers**; Content Risk reported faster crisis setup and better accuracy than the legacy tool.

Cross-team coordination and stakeholder ownership. Coordinated three teams on the crisis tool — Applied Science (LLM hosting), Data Science (the models) and Trust & Safety — across mixed Argentina/US West Coast teams and a 4-5 hour time gap. Engineering point of contact for Trust & Safety on all three projects: discovery sessions and regular demos with the agents who use the tooling, translating their operational needs into technical scope.

Mentoring and code quality. Mentored the frontend engineer I partnered with, promoted from mid-level to senior over the reporting project; in-depth code review across the team. Also scoped the long-deferred migration of the legacy PHP action layer into Kotlin.

Technologies: Kotlin, PHP (legacy), GraphQL, MySQL, Kafka with Avro schemas, webhooks, REST, Kubernetes, Helm, Argo CD, LLM integration, AWS, Coralogix.

Backend Engineer (Golang/Python) · Mercado Libre

September 2023 - November 2024

Developed, supported and scaled backend systems for the machine learning application that estimates package delivery times across the largest e-commerce platform in Latin America.

Ran project analysis, proposed and drove improvements, managed the backlog and led initiatives within the team.

Technologies: Golang, Python, SQL, NoSQL, New Relic, Kibana, Datadog.

Backend Engineer (Golang) · Mercado Libre

April 2021 - September 2023

Developed, supported and enhanced the backend services behind the payment reservation and release flow of a digital wallet serving millions of users.

Technologies: Golang, Python, SQL, NoSQL, Pub/Sub, message queues.

Earlier Python Developer · Globant (2020-2021) · Backend Developer / Seismic Data Analyst · ExxonMobil (2017-2020) · Python Course Assistant · CoderHouse (2021)

Technical Skills

Languages Kotlin (advanced), Golang (advanced), Python (advanced), C# (intermediate), C/C++ (intermediate), PHP (working knowledge).

Data & messaging MySQL, NoSQL, Kafka with Avro schemas, Pub/Sub, webhooks, event-driven and async processing.

Platform REST, GraphQL, HTTP, Docker, Kubernetes (intermediate), Helm, Argo CD, CI/CD, AWS (intermediate). Observability: Coralogix, Datadog, New Relic, Kibana.

AI / LLM LLM services in production backends: async job orchestration, event-driven callbacks, pre-filtering for cost and latency control.

Practices Project leadership, PRDs and design docs, estimation, story breakdown, code review, mentoring, cross-team coordination, Agile.

Languages Spanish native · English C2 · French B1 · Italian · German A2 · Chinese (basic)
